Overview

-

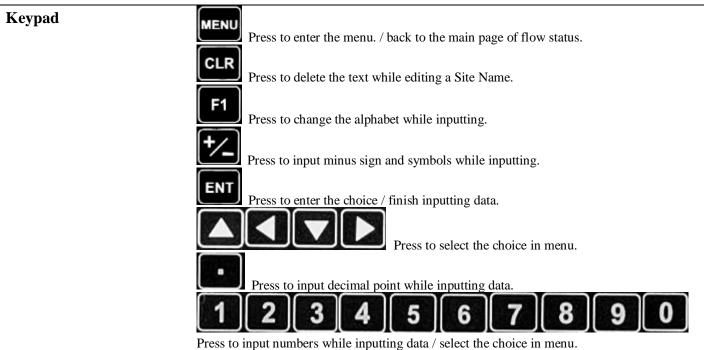

-			
Introduction	Xonic100LM Ultrasonic Open Channel Flowmeter use ultrasonic transit-time method for flow velocity and use level transmitter to receive level data. User can use either 4 path or 2 path for measuring the open channel application. Xonic 100LM is newly developed and has very sophisticated diagnostic functions for better performance. Xonic 100LM use certified new technology, PATENT "Very precise time measurement method" also with PATENT "Transducer Design for Open Channel". The patent is about transducers alignment method in field, and engineers can align one transducers to opposite transducer very precisely with laser pointer. Xonic 100 transducers are designed as a ball type, so the transducer can be aligned to all directions.		
Application	 Water Supply, Drainage, Water Purification Facility (Clean Water, Municipal Water, Waste Water, Manure and Etc.) Steel Factory and Mining Industries (Lime Stone Slurries, De-Ionized Water and Etc.) Power Plants 		
Features	 Patent 10-0560364 Patent 10-0918369 Patented AR Mode (Anti-Round) 		
Specifications			
Identification of Product			
Identification of Product	 Transducer : NEMA 7 (IP68, Water Proof) On the right side of flowmeter, there is a silver sticker with per product's S/N. 		
Identification of Product	Transducer : NEMA 7 (IP68, Water Proof) On the right side of flowmeter, there is a silver sticker with per product's S/N. This is Identification of the product. Ultrasonic Flowmeter

Instructions - Transducers Installation

The ALSONIC-AVM may be used in rectangular, circular, trapezoidal or other shaped channels. Since the transducers create almost no restriction, virtually no head loss is created. The advanced DSP-based flow computer with cross-correlation and FFT technology allows this system to work in the most difficult applications, including those involving liquids with high concentrations of suspended solids & air or a large noise component. Please read this manual carefully before installation.

e.g.) Open Channel - Dual Path

Tightly assemble Transducers with Brackets with screws.

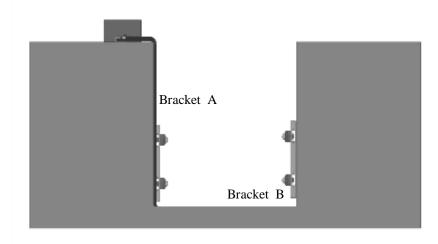

Step 1: Assembling Sensor and Bracket

Step 2: Mounting Bracket

Select the right mounting place is the most important thing for ensuring the accuracy. Please according to the follow steps to install the mounting bracket.

- 1) Install Bracket A on the wall tightly.
- 2) Confirm the installation place for Bracket B, than install Bracket B on the opposite wall tightly.

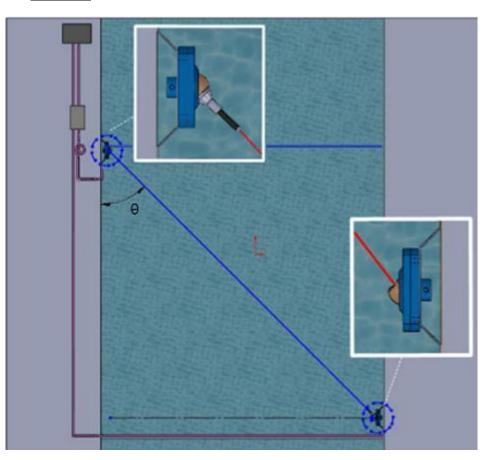

Step 3: Angle Adjustment & Installation of Laser Pointer

In the case of Open Channel, it needs Laser Pointer to work with Transducers for allowing the flow measurement. One pair of sensor will have a unit of Laser Pointer. In order to receive good signals for having the best accurcy, all transducers must be adjusted to the same angle. The angel shall be measured from the CENTER of sensor to the mounting wall.

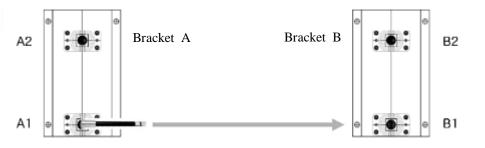

<u>Caution) The installation of Laser Pointer doesn't affect the measurement. User can</u> install it at either Bracket A or Bracket B.

1) Bracket B : Alighting the Transducers on to the angle 45° .

- 2) Bracket A : From the Laser Pointer, use can see there is a Button on each Laser Pointer.
- 2.1)Fix a Laser Pointer on A1 transducer, and pointing the direction of B1.
- 2.2)Fix a Laser Pointer on A2 transducer, and pointing the direction of B2.

Step 4: Install Flowmeter and Connect

Each cable should be connected to the transducers and the other side should be connected to the flow computer.

Step 5: Supply Power to Flow Computer

Connecting the Power Cable of the flow computer and turn on the power.

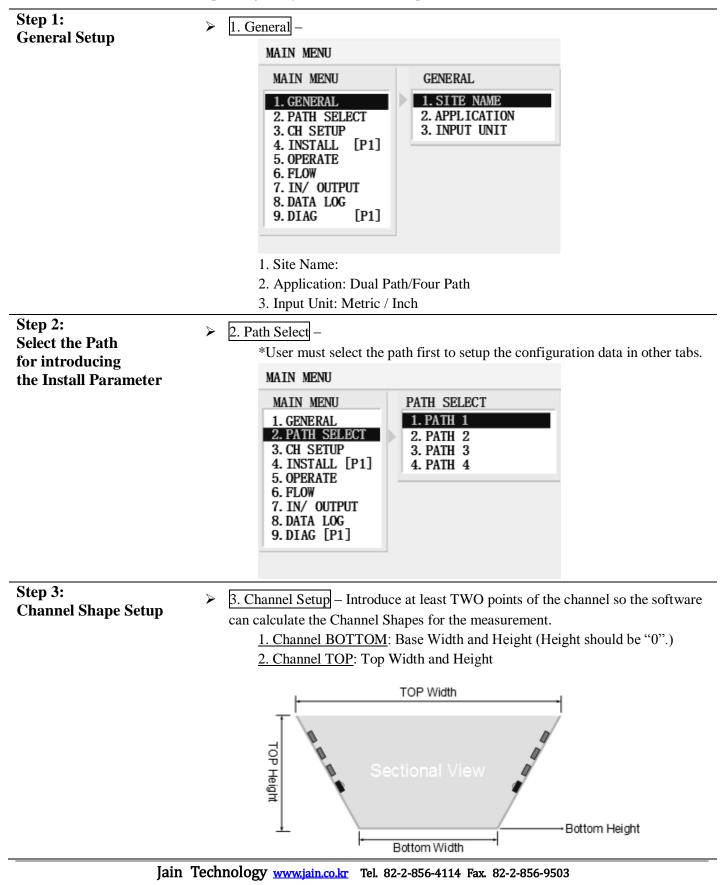

Step 6: Input the Values on Flow Computer

Please refer to next chapter for input the parameters of the open channel.

Instructions– Installation Quick Setup

This chapter provides user an overview and summary of Transducer Set Up Procedures. But user shall review all the chapter to set configuration data before operating the system in the actual Open Channel site.

Step 4: *IMPORTANT* Path Parameters Setup

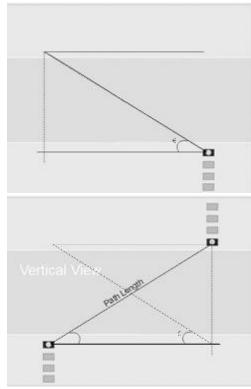

▶ 4. Install – set up the configuration data for each path.

MAIN MENU	INSTALL
1. GENERAL	1. SENSOR TYPE
2. PATH SELECT	2. PATH HEIGHT
3. CH SETUP	3. PATH LENGTH
4. INSTALL [P1]	4. PATH ANGLE
5. OPERATE	5. PATH HEIGHT OPT
6. FLOW	6. AUTO INSTALL
7. IN/ OUTPUT	7. RESERVE INSTALL
8. DATA LOG	8. INSTALL INFO.
9. DIAG [P1]	9. ACTUAL ZERO

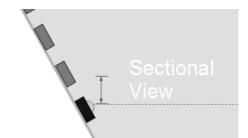

- 1. Sensor Type: D for small channel / F for big channel
- 2. Path Height: the mounting height from the bottom.

- 3. Path Length: the length between 2 transducers. (Lens to Lens)
- 4. Path Angle: the angle between path length and path distance (CH width).

5. Path Height Option: Increase the measuring range for each path.

7. Reserve Install: *click SET for each path to enable the auto installation.

(After setup the information for Path One. User needs to go back to 2. Path Select to select other path and setup the install parameters individually in 4. Install.)

Instructions - Quick Analog Output

The flowmeter provides two 4-20 mA analog output for user. User can assign each data with Analog Out [1] and Analog Output [2] individually.

Caution) Before start this chapter, make sure user have configured the Flow Range Limited in the tab, 5. OPERATE and the units in the tab, 6.FLOW.

Step 1: Analog Output Setup

The analog output variable provides the signal value for flow rate. The standard range of output is in the 4-20 mA. User can Configure the parameters for the output device in the tab, **7.IN/OUTPUT**.

MAIN MENU

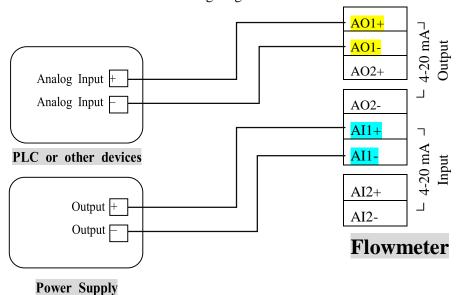

MAIN MENU 1. GENERAL	IN/OUTPUT 1. ANALOG OUT [1]	ANALOG OUT [1]
2. PATH SELECT 3. CH SETUP 4. INSTALL [P1] 5. OPERATE 6. FLOW 7. IN/OUTPUT 8. DATA LOG	2. ANALOG OUT [2] 3. RELAY OUT [1] 4. RELAY OUT [2] 5. ANALOG IN [1] 6. ANALOG IN [2] 7. LEVEL METER SET	2. OUTPUT MODE 3. CALIBRATION_MIN 4. CALIBRATION_MAX 5. SPAN MIN 6. SPAN MAX 7. 2mA SET
9. DIAG [P1]		

Press [MENU] - 7. IN/OUTPUT - 1. ANALOG OUT [1] or 2. ANALOG OUT [2]

- ▶ 7.1.1. Output Data Choose the required data for output.
 - 1. None (Disable)
 - 2. Flow
 - 3. Velocity
 - 4. Analog In [1]
 - 5. Analog In [2]
- 7.1.2. Output Mode Depending on the measuring application.
 - 1. By application (Automatically)
 - 2. [CH 1] Only (for Single Path)
 - 3. [CH 2] Only (for Dual Path)
- ▶ 7.1.3. Calibration MIN initial setup by manufactory.
- > 7.1.4. Calibration MAX initial setup by manufactory.
- 7.1.5. Span MIN Introduce for Lower Flow Value. 4 mA
- 7.1.6. Span MAX Introduce for Upper Flow Value. 20 m A
- > 7.1.7. 2mA Set initial setup by manufactory.

Step 2: Connect Devices

Turn off flowmeter and wiring the connecting devices to the selected OUTPUT on flowmeter's PC board as below wiring diagram.

Step 3:After reboot the flowmeter, the connecting device shall be able to receive the output
data smoothly.Power Ondata smoothly.

Instructions - Analog Input for Level Meter

	with Analog In [1] and Ar <i>Caution) In the case of O</i>	alog In [2] individually.	r user. User can assign each data <u>connect a level transmitter</u> <u>smitter.</u>
Step 1: Analog Input Setup	The standard range of output is in the 4–20 mA. User can Configure the parameters for the input device in the tab, 7.IN/OUTPUT . MAIN MENU

		g In [1] / Analog In [2] it of level transmitter is "mn	n" or "inch".

Step 3: Connect Devices

Step 4: Power On &

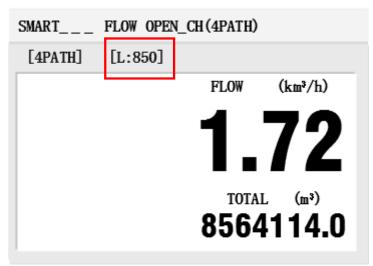

Check Input Data

Turn off flowmeter and wiring the connecting devices to the selected INPUT on flowmeter's PC board as below wiring diagram.

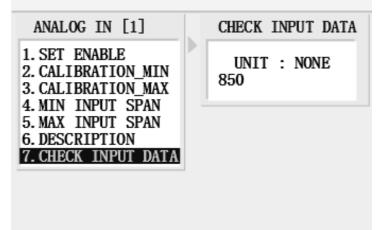

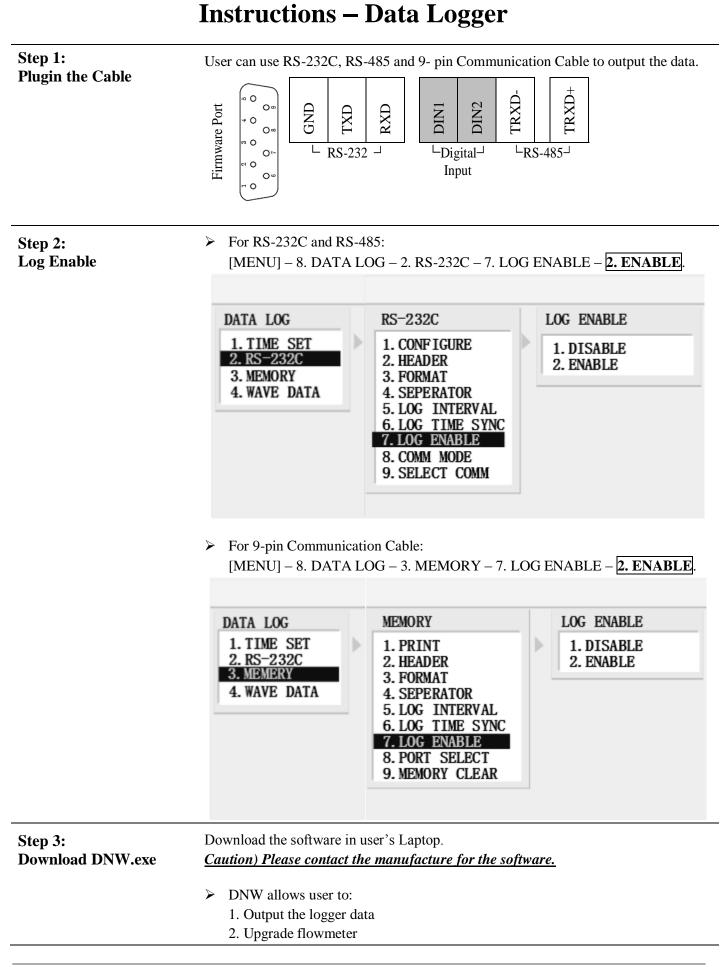

Power Supply

After connecting, user shall see the Input data in the MAIN display as below.

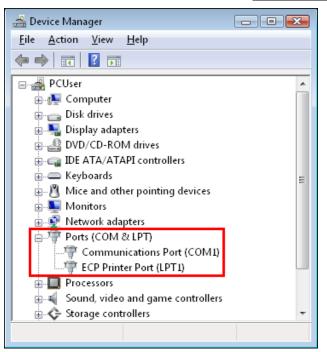

Or user can check in the tab, 7.5.7. Check Input Data to check the input data as well.

Step 4: Laptop's Port Setup

- > Open the "Device Manager" on user's Laptop.
- ▶ Find "PORTS (COM & LPT)" and click "Communications Port".

> Open the tab, Port Settings and click "Advanced".

Prolific USB-to-Serial Comm Port (COM10) Properties	23
Genera Port Settings priver Details	
	۱ ۲
Bits per second: 9600 -]
Data bits: 8 🗸	
Parity: None	
Stop bits: 1	í
Flow control: None	
Advanced Restore Default	
Advariced Restore Deraul	

Feel free to set the COM Port Number to "COM 1/COM 2/COM 3/COM 4". (*The software "DNW" works with COM 1~4 only.)

COM Port Number:	COM4 +	ОК

> Then, click "OK" button and close the Device Manager to complete the setting

Step 5: Setup DNW

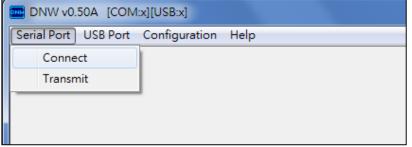

Caution) Make sure NOT to turn on flowmeter's power at this step

23
^

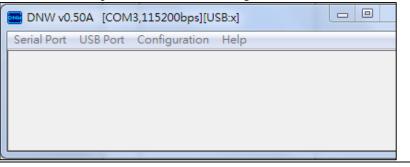

➤ User will see the window of "UART/USB Options" as below.

UART/USB Options		
Serial Port Baud Rate 6 115200 57600 38400 19200 14400 9600	COM Port C COM 1 C COM 2 C COM 3 C COM 4	OK Cancel
USB Port Download Address 0xc000000		

- Set the Baud Rate at "115200" and the COM Port that user just set.
- > After return to DNW, open the "Serial Port" menu and click "Connect"

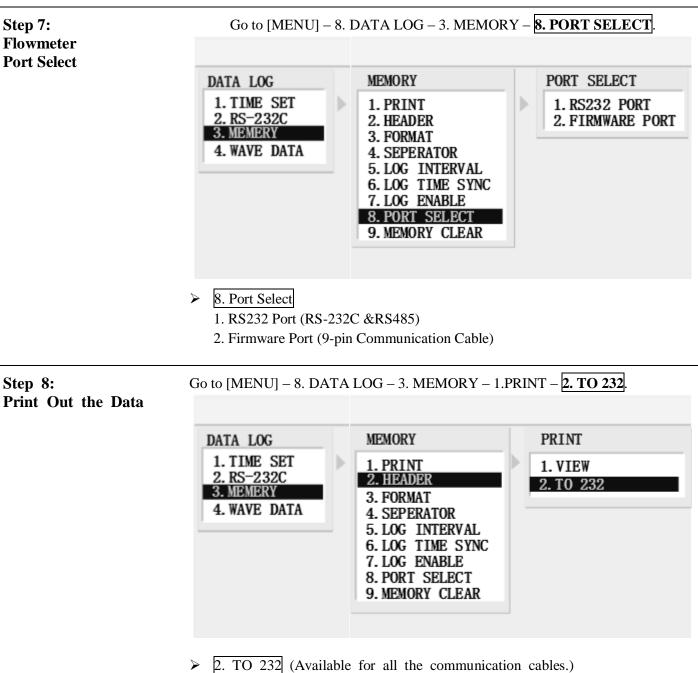

After Connecting, user will see the information which just been setup and shows on the top of the window as figure.

Step 6: Power On

> Press "U" key on Laptop and turn on flowmeter's power at the same.

Press [ENT] to output the data. Then, user will see DNW is downloading the data automatically.

Setting Operation - General Setting

1.1 GENERAL - Site Name	 User must input Site Name to record the flow data of the site. The name will be registered with other operation setting. Press [MENU] - <u>1.GENERAL</u> - <u>1.SITE NAME</u> Move cursor by [◀] [▶]. Input alphabet characters by [F1]. Delete characters by [CLR]. Leave the edit mode by pressing [ENT].
1.2 GENERAL - Application	There're two kinds of system for Open Channel Application, Dual and Four Path. Press [MENU] – <u>1.GENERAL</u> – <u>2.APPLICATION</u> • <u>OPEN CHANNEL-4 PATH</u> • <u>OPEN CHANNEL-2 PATH</u> • <u>OPEN CHANNEL-2 PATH</u>
1.3 GENERAL - Input Unit	User can use either "mm" or "inch" for the input unit. Press [MENU] – <u>1.GENERAL</u> – <u>3.INPUT UNIT</u> • <u>Millimeter</u> • <u>Inches</u> GENERAL 1. SITE NAME 2. APPLICATION 3. INPUT UNIT

Setting Operation – Channel Setup

2. PATH SELECT –

Select the Path to setup the install parameters for each path.

Press [MENU] – <u>2.PATH SELECT</u>

- PATH 1
- PATH 2
- <u>PATH 3</u>
 <u>PATH 4</u>

MAIN MENU MAIN MENU 1. GENERAL 2. PATH SELECT 3. CH SETUP 4. INSTALL [P1] 5. OPERATE 6. FLOW 7. IN/ OUTPUT 8. DATA LOG 9. DIAG [P1] MAIN MENU PATH SELECT 1. PATH 1 2. PATH 2 3. PATH 3 4. 22

About Installation

There's some technical information about Reserve Installation that user need to know. The Reserve Installation was programed to perform the function automatically once the level has reach the Expected Height of Each Path.

(Here we will use the Dual path application as an example to explain.)

Example		
1.2 Application	Open Channel Dual Path	
2. Path Select	Path 1	Path 2
4.2 Path Height	100mm	250mm
4.5 Path Height OPT	50mm	50mm
4.7 Reserve Install	SET	SET

- What is the Expected Height of each Path?
 - 4.2. PATH HEIGHT + 4.5. PATH HEIGHT
- When the software will do the installation?
 - The Expected Height of Path 1 is" 150mm" and Path 2 is "300mm". Hence, the software will perform the Installation of Path 1 automatically when the level reach or over 150mm. And once the level is reach the Expected Height of Path 2(300mm). It will perform the installation automatically again for Path 2.
- How to make sure the installation is completed?

- There are some points user can check for the installation:

- Sound Vs:
- In the case of 20 degree's water, the Sound Velocity shall around 1480m/s.
- Gain Level: <u>Must be under 1500.</u>
- When the Gain is Higher than 1500, it means Ultrasonic Signal is weak.
 Signal Shape: Like below attached figure shows.
 - The Best Ultrasonic Signal shall have the most spired shape in middle area.
- How to access this display to check the Signals?
 - Press [F1] + Number [2] in the Main Display. (same keys to return)
- Troubleshooting:

If the flowmeter couldn't find the best wave frequency after running Auto Install, user could try to search the best signal manually. But it rarely happen.

> User could refer to the "RISC" value in this screen as the TOTAL LENGTH of the signal. Press [←] [→] multiple times to move the current position of RISC Value.
 Press [↑] [↓] multiple times to move the current position of Frequency.

 Press [MENU] – <u>4.INSTALL</u> – <u>6.INSTALL INFO</u> <u>Install Path Length</u> > Before run "Auto Install", it will showing "Not installed" even user has input the path length. > The actual path length will be calculated automatically after user run "4.6 Auto Install". > If the software has performed "Reserve Install", it will shows "Install Reserved". 	INSTALL 1. SENSOR TYPE 2. PATH HEIGHT 3. PATH LENGTH 4. PATH ANGLE 5. PATH HEIGHT OPT 6. AUTO INSTALL 7. RESERVE INSTALL 8. INSTALL INFO. 9. ACTUAL ZERO
shows other values instead of "0". This function,	Actual Zero can help user to adjust
 Press [MENU] – <u>4. INSTALL</u> – <u>8. ACTUAL ZERO</u> <u>Actual Zero User (automatic adjustment by software)</u> <u>Actual Zero Set (manual adjustment by user)</u> <u>Actual Zero Reset (clear data to zero)</u> <u>Actual Zero Auto (when user couldn't stop the flow)</u> 	INSTALL ACTUAL ZERO 1. Actual Zero Reset, is the function to clear the data after perform "Actual Zero User/Actual Zero Auto after perform "Actual Zero User/Actual Zero Au

Setting Operation – Operating Condition

5. Operate -

Before installing the transducer, set the operating condition in the main menu to allow measurements.

Caution) The measurement might have some errors without these settings.

	MAIN MENU	
Press [MENU] – <u>5.0PERATE</u>	MAIN MENU 1. GENERAL 2. PATH SELECT	OPERATE 1. UPPER FLOW LIMIT 2. LOWER FLOW LIMIT
	3. CH SETUP 4. INSTALL [P1] 5. OPERATE 6. FLOW 7. IN/ OUTPUT 8. DATA LOG 9. DIAG [P1]	3. DEAD LEVEL 4. DEAD ZONE 5. FLOW AVERAGE TIME 6. TOTAL FLOW SET 7. ALARM 8. CALIBRATION 9. ENABLE AGC 0. DAMPING

5.1 Operate – Upper Flow Limit

Set the MAXIMUM measuring range of the flow so the software will measure the flow when not exceeds the limited flow rate.

1. UPPER FLOW LIMIT 2. LOWER FLOW LIMIT 3. DEAD LEVEL 4. DEAD ZONE 5. FLOW AVERAGE TIME 6. TOTAL FLOW SET 7. ALARM 8. CALIBRATION 9. ENABLE AGC 0. DAMPING	Press [MENU] – <u>5.0PERATE</u> – <u>1.UPPER FLOW LIMIT</u>	OPERATE	UPPER FLOW LIMIT
		2. LOWER FLOW LIMIT 3. DEAD LEVEL 4. DEAD ZONE 5. FLOW AVERAGE TIME 6. TOTAL FLOW SET 7. ALARM 8. CALIBRATION	

5.2 Operate – Lower Flow Limit

Set the MINIMUM measuring range of the flow so that measuring rate will not lower than the limited flow rate.

Press [MENU] – <u>5.0PERATE</u> – <u>2.LOWER FLOW LIMIT</u>	OPERATE 1. UPPER FLOW LIMIT 2. LOWER FLOW LIMIT 3. DEAD LEVEL 4. DEAD ZONE 5. FLOW AVERAGE TIME 6. TOTAL FLOW SET 7. ALARM 8. CALIBRATION 9. ENABLE AGC	LOWER FLOW LIMIT Unit : m ³ /hour -20000.000

5.3 Operate – Dead Level

Dead Level, so called "Blanking Level". In some cases, flow rate may be disregard due to small flow in the big channel. Therefore, user can perform the function, so the flowmeter can be set to ignore a level of the channel bottom to aviod false echoes from obstructions.

Press [MENU] - 6.0PERATE - 3.DEAD LEVEL

OPERATE	DEAD LEVEL
1. UPPER FLOW LIMIT 2. LOWER FLOW LIMIT 3. DEAD LEVEL 4. FLOW AVERAGE TIME 5. TOTAL FLOW SET 6. ALARM 7. CALIBRATION 8. ENABLE AGC 9. DAMP ING	Unit : mm
